

OUTLINE OF TOPICS

	PAGE
1. The classification of animals	461
1a. Comparison of genealogical classification with other types of taxonomy: the phylogenetic series	
1b. The criteria for distinguishing races or varieties, species, genera, and all higher taxonomic groupings	
2. Genetic variation in the course of generations	
2a. Comparison of variation under conditions of natural and artificial breeding	462
2b. Characteristics which are more and less variable genetically: their bearing on the distinction of races, species, and genera	
3. The process of heredity	
3a. The inheritance of acquired characteristics: the use and disuse of parts	

	PAQI
3b. The inheritance and variability of instincts	462
3c. Interbreeding and crossbreeding: hybridism and sterility	
3d. Atavisms and reversions to ancestral type	463
3e. Marked and abrupt mutations in a single generation as opposed to the continuous accumulation of slight and imperceptible variations	
4. The problem of evolution: the origin of plant and animal species	
4a. The question of ultimate origins: the creation of primordial life in one or many forms; the original generation of life from inorganic matter	
4b. The fixity or the mutability of species	
4c. The origin of new forms of life: special creation, spontaneous generation, or descent with modification from older forms	
4d. The direction of evolution: progress and recession	464
5. The theory of evolution: the origin of new species from a common ancestry	
5a. The struggle for existence: its causes and consequences	
(1) Natural selection: the survival of the fittest	
(2) The extinction of intermediate varieties	
(3) Difficulties with the theory of natural selection: its limitations	
5b. Competition in mating: sexual selection	
5c. The geographical and physiological factors in breeding: accessibility, fertility, and sterility	
6. The facts of evolution: evidences bearing on the history of life on earth	
6a. The geological record: the significance of fossil remains	
6b. The geographical distribution of the forms of life in relation to the genealogy of existing species	
6c. Comparative anatomy and embryology: the meaning of rudimentary or vestigial organs and functions	
7. The origin and development of man	465
7a. The doctrine of man's special creation: in body, in soul	
7b. The theory of the evolutionary origin of man from lower forms of animal life: descent from an ancestor common to man and the anthropoids	
(1) Anatomical, physiological, and embryological evidences of an organic affinity between man and other mammalian forms of life	
(2) Paleontological evidences: the missing link in man's ancestry	
(3) Psychological evidences: the human mind in relation to animal intelligence	
7c. Biological evolution in the course of human generation: from prehistoric to historic man
